Scenario ID	JIRA ID name	SW Requirement	SY Requirement	Positive
1	Add an option to reset to preference default	NA(No requirement present)	NA(No requirement present)	Pre-requisite: Ensure to change implant [Journey II XR], deformity[<7 Varus, <10 flex] and change preference values in SPP screen. Create a **TKA case with Journey II XR and simulate deformity of [<7 varus, <10 flex]**-->Navigate till **Combined Planning (with/without gaps**)--> Select **more option** widget--> Verify that there are two options for reset, **Reset to personalized femur plan and Reset to personalized tibia plan**-->Verify that they are **enabled**-->Verify that the button design matches other buttons present in More options widget

2		NA(No requirement present)	NA(No requirement present)	Continue from **G2**--> Navigate back to **Combined planning** screen-->Record resection depth, varus/valgus values, flexion/extention and slope values from all implant views--> Change **implant position** for **only one parameter each for both femur and tiba**--> Select **more options**--> Select to **Reset personalized femur plan**--> Verify that the resection depth, varus/valgus **values return back to preferences set in SPP screen**-->Navigate to **Plan Tibia using widget**--> Verify that the **resection depth** and **slope values** displayed **are same as preference values** set in SPP screen

3		NA(No requirement present)	NA(No requirement present)	Pre-requisite: Ensure to change implant [Journey II XR], deformity[<7 Varus, <10 flex] and record preference parameters in SPP screen. **Create a TKA** case with **Journey II XR**--> **Simulate** deformity **[<7 varus, <10 flex]**--> Navigate to **Combined planning screen**--> Change the **implant position**-->Select **more widgets**-->**Select Reset** to personalized femur plan--> Verify that the **resection depth values, varus/valgus and flexion extention values for femur** are reset to the preference values saved in SPP--> Select more widgets--> Select Reset Femur Position button--> Verify that the **resection depth values, varus/valgus** and **flexion extention values** for femur are reset to implant default which is different from preference values
4		NA(No requirement present)	NA(No requirement present)	Continue from **G4**-->Select **more widgets**-->**Select Reset** to **personalized tibia plan**--> Verify that the resection depth values, varus/valgus and slope values **for tibia are reset to the preference values** saved in SPP--> Select **more widgets**--> **Select Reset Tibia Position** button--> Verify that the **resection depth values, varus/valgus and slope values for tibia are reset to implant default** which is different from preference values

5		NA(No requirement present)	NA(No requirement present)	Continue from **G5**--> Navigate to **Plan Tibia** through more options widget-->**Change** implant positions--> Select **Reset Tibia position**--> Navigate to **Combined Planning** screen--> Select **more widgets**-->Select **Reset to personalized tibia plan**--> Verify that **the resection depth values, varus/valgus and slope values for tibia are reset to the preference values** saved in **SPP**
6		NA(No requirement present)	NA(No requirement present)	Continue from **G6**-->Navigate to **Plan Femur** through **more options widget**-->**Change** implant positions-->Navigate to **Combined Planning screen**-->Select **more options widget**--> Select **Reset Femur position**-->Verify that the **implant positions change to implant defaults** and does not match with preference values saved in SPP-->Select **more options widget**--> Select **Reset to personalized femur plan-->** Verify that **resection depth values, varus/valgus values, flexion extention values changes to preference values set in SPP**

7		NA(No requirement present)	NA(No requirement present)	Pre-requisite: Ensure to **create a TKA case** with **Legion PS** and **deformity [> 7 Valgus > 10 flex]**and complete it in 1.7 software version or earlier Uparde **software version to CORI 2.0**--> Navigate to **SPP**--> Select **Legion PS** and **deformity [> 7 valgus < 10 flex]**--> **Change parameters**--> **Record** the **preference parameters**--> **Quit** from SPP--> **Resume** case--> **Navigate** to **Combined Planning screen**--> **Select** more options widget--> Verify that Reset to personalized femur and tibia buttons **are disabled**--> **Navigate back** and clear all points till **Robotic drill connection** state--> **Simulate deformity [> 7 valgus < 10 flex]** --> Navigate till **combined planning screen**--> Select more options widget--->Verify that Reset to personalized femur and tibia buttons **are enabled--> Change implant positions** for **both femur and tibia--> Select more options widget--> Click** Reset to personalized femur and tibia buttons**-->** Verify that the **implant positions values matches with preference values** saved in SPP

Negative	Boundary Analysis
Pre-requisite: Navigate to SPP and select implant [Journey II CR]--> Quit **Create a TKA** case with Journey II CR-->Navigate to **Combined Planning**--> Select **more options** widget--> Verify that Reset to personalized femur plan and tibia plan buttons **are disabled--> Change implants** other than **Journey II CR** and check in **more widgets that Reset to personalized femur plan and tibia plan buttons are disabled**	NA

Pre-requisite: Navigate to SPP and select deformity [<7 varus, < 10 flex]--> Quit **Create a TKA** case with Anthem PS-->Simulate deformity [<7 varus, < 10 flex]-->Navigate to **Combined Planning**--> Select **more options** widget--> Verify that Reset to personalized femur plan and tibia plan buttons **are disabled--> Change implants** other than Anthem PS and check in **more widgets that Reset to personalized femur plan and tibia plan buttons are disabled**	

Pre-requisite: Ensure to create a new surgeon and don't access SPP Launcher **Log in** as surgeon--> **Create** a new TKA case with Anthem PS--> Navigate to **Combined Planning**--> Select **more options** widget--> Verify that **Reset to personalized femur plan and tibia plan** buttons are **disabled--> Change implants** in **combined planning** screen **-->** Verify for **each implant** that **Reset to personalized femur plan** and **tibia plan buttons** are **disabled**	
Continue from **H3**--> **quit** from case--> Navigate to **SPP screen**--> **Change implant** to Legion PS, deformity [<7 varus, >10 flex]--> **Change preference** parameters--> Quit--> Reset case--> **Simulate deformity [<7 varus, >10 flex]**--> Navigate to **Combined planning screen**--> Select **more options** widget--> Verify for each implant that Reset to personalized femur plan and tibia plan buttons **are disabled**--> **Change implants in Combined planning** screen and verify that except for Legion PS the reset buttons for personlaized femur and tibia plan **are disabled**	

Continue from G3--> Navigate to **Plan Femur**--> Verify that there is only one Reset button present for resetting to implant default--> Navigate to Plan Tibia through Combined Planning**-->Verify that there is only one Reset button present for resetting to implant default**	
Pre-requisite: Ensure to change implant [Journey II BCS], deformity[<7 Varus, >10 flex] and change preference values in SPP screen. **Log in** as surgeon--> Create a new TKA case with Journey II BCS--> **Simulate** deformity o**f [> 7 valgus, >10 flex]**--->Navigate to Combined Planning--> Select more options widget--> Verify that Reset to personalized femur plan and tibia plan buttons **are disabled**	

Pre-requisite: Ensure to change implant [Journey II CR], deformity[<7 Varus, >10 flex], Change preference paraameters. Change implant [Legion CR], deformity [>7 Valgus, > 10 flex], change preference parameters. Start TKA case with **Legion CR**--> Simulate **deformity [<7 Varus, >10 flex]**--> Navigate to combined planning-->Select **more options widget**--> Verify that **Reset to personalized femur plan and tibia plan buttons are disabled--> Change implant** on Combined planning screen to **Journey II CR-->**Select **more options widget--> ** Verify that **Reset to personalized femur plan and tibia plan buttons are enabled-->** Navigate back **till Robotic drill connection state and clear points--> Simulate deformity [>7 Valgus, > 10 flex]--**> Navigate to combined planning-->Select more options widget--> Verify that Reset to personalized femur plan and tibia plan buttons are disabled	
Pre-requisite: Ensure to create a new surgeon and start the following test steps without accessing SPP widget. **Start TKA** case with **Legion CR**--> Simulate **deformity [<7 Varus, >10 flex]**--> Navigate to **combined planning**-->Verify that **Reset to personalized femur plan and tibia plan buttons are disabled**--> Click on the buttons and verify that **no change is observed on implant positions for both femur and tibia.**	

State Transition	Combination Testing
Continue from **H5**-->**Navigate back** and **clear all points** till **Robotic Drill connection state**--> **Collect** good points and **simulate deformity [<7 Varus, >10 flex]** --> Navigate to **Combined Planning screen**--> **Select more options** widget--> Verify that Reset to personalized femur plan and tibia plan buttons **are enabled**	Pre-requisite: Ensure to change implant [Anthem PS], deformity[<7 Varus, <10 flex] and change preference values in SPP screen. Create a **TKA case with Anthem PS and simulate deformity of [<7 varus, <10 flex]**-->Navigate till **Combined Planning (with/without gaps**)--> Chnage implant positions-->Select **more option** widget--> Verify that there are two options for reset, **Reset to personalized femur plan and Reset to personalized tibia plan**-->Verify that they are **enabled**-->Verify that the button design matches other buttons present in More options widget-->Change implant positions-->Click on **Reset to personalized plan buttons for femur and tibia**-->Verify that the implant positions reset to preference values set in SPP -->**Click Quit** from case--> Navigate to SPP--> change preference paramters--> **Quit** from SPP--> **Resume** case--> Navigate to Combined planning screen--> Select more option widget-->Click on Reset to personalized plan buttons for femur and tibia-->Verify that the implant positions reset to preference values set in SPP

Pre-requisite: Ensure to change implant [Genesis II PS], deformity[>7 Varus, >10 flex] and change preference values in SPP screen.

Create a **TKA case with Genesis II PS and simulate deformity of [>7 varus, >10 flex]**-->Navigate till **Combined Planning (with/without gaps**)--> Change implant positions--> Change implant positions-->Select more option widget-->Click on **Reset to personalized plan buttons for femur and tibia**-->Verify that the implant positions reset to preference values set in SPP -->**Click Quit** from case--> Navigate to SPP--> Reset the preference plan--> Record preference values-->**Quit** from SPP--> **Resume** case--> Navigate to Combined planning screen--> Select more option widget-->Click on Reset to personalized plan buttons for femur and tibia-->Verify that the implant positions reset to preference values set in SPP
