Jira Description	Feature
<p>Scenario Description: Upon logging into an Admin account for the first time, the user needs to be prompted to change their password before entering the Admin menu. This is applicable to the Primary Admin as well as all subsequent Standard Admin users.</p> <p>On shipping the system, the Primary Admin shall have a default username and password, but will be prompted to change the password upon the initial login.</p> <p>This ticket captures the work required to implement the first time Admin login prompts, as well as the default Primary Admin credentials upon first use of the system.</p> <p>On shipping, the system will come equipped with a single Primary Admin user available. This Primary Admin will be given a basic default username and password to support initial login:</p> <p>Default username: admin</p> <p>Default password: 12345</p> <p>Upon successfully logging in with these default credentials, the software will immediately prompt the user to change the password (the username can be changed later, if desired, via the Admin Manager widget on the Admin screen). The wireframe for this workflow is below.</p>	Admin Login

After the Primary Admin user has logged in for the first time and has changed their password, they have the ability to create other Standard Admin user accounts. The Primary Admin user will set the username and password for each Standard Admin account they create.

After the Primary Admin user has logged in for the first time and has changed their password, they have the ability to create other Standard Admin user accounts. The Primary Admin user will set the username and password for each Standard Admin account they create.

When the Standard Admin logs into their account with the username and password assigned to them by the Primary Admin user, they will also be prompted to change their password upon the initial login (per the above wireframe).

Definition of Done:

For all new systems, the Primary Admin user will be given a basic, default username and password for initial login.

Standard Admin users will be given a username and password by the Primary Admin user that creates their account.

For all Admin users (Primary and Standard), upon the first login to the account, they will be prompted to change the password. This is not optional.

Definition of Done:

Administrator login requires a username and password

“Continue” button is disabled until at least one character is entered in both the username and password fields

Password complexity requirements are implemented

Testing Strategy: Not added

Tools Used: N/A
